Filtering by Biological Community

Biological Community/Data Type filter

- Fish community data includes total abundance of each taxon within a sampling reach as well as supporting information such as length and weight and methods of collection.
- Invertebrate community data includes abundance of each taxon within a sampling area in a reach as well as supporting information such as microhabitat measures.
- Algae community data includes abundance of each taxon within a sampling area in a reach with supporting information such as microhabitat measures
- Physical site condition, reach habitat, solar pathfinder and water column light intensity data are measures from the environment where the community data is collected.

Hints and Tricks:

- Biological communities can be combined
- Physical habitat samples can also be combined with biological communities
